

Total Internet Access Solutions from Telsoft Limited

TrafficTracker is an Internet Gateway Billing application that will keep a track of users internet usage, as well as providing secure login to registered users.

Boasting an easy to use interface, TrafficTracker makes managing user access to the internet easy and simple.

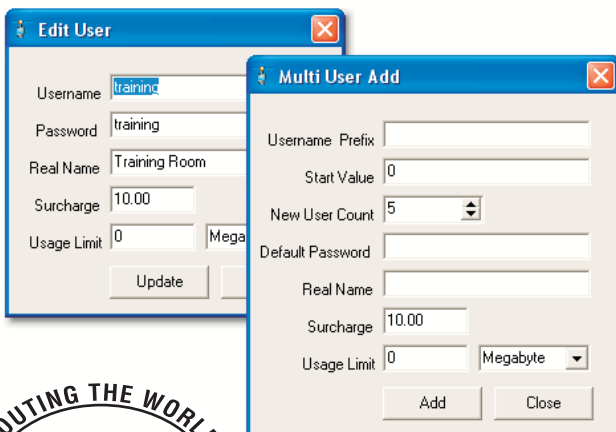

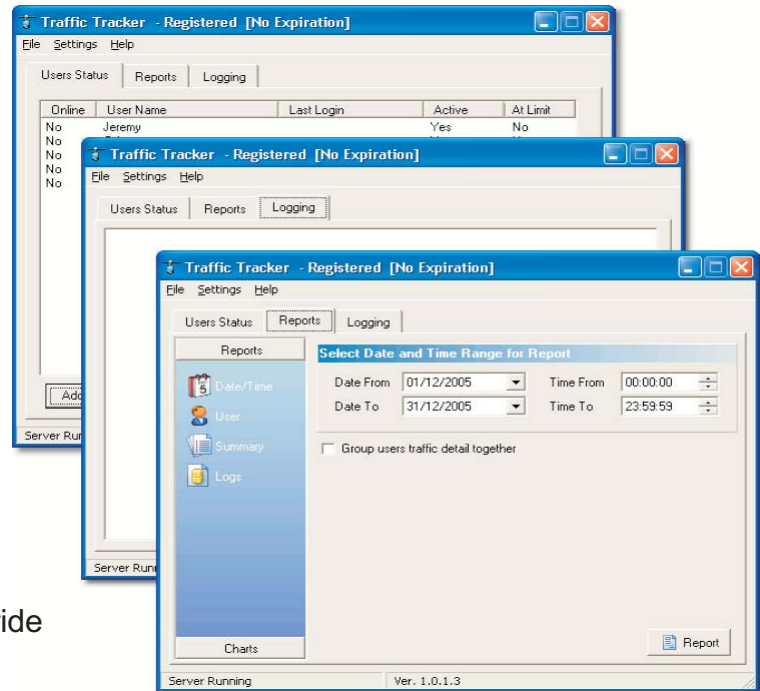

TrafficTracker lets you set user limits, and will automatically deactivate the user when the users limit has been reached to prevent the user from accessing the internet. The limits can be set by traffic usage, or by time. Users can easily be re-activated with the original limits applied.

TrafficTracker gives you the ability to not only specify your own costs and surcharges, but also lets you override these values for a specific user if required.

TrafficTracker also has the functionality to edit and print out instructions for users to follow when they connect to your network and how to log off. The instructions also include the users username and password for them to reference at any time.

There are also reports that let you get information on current and past users, as well as help keep an eye on failed login attempts, plus a report to summarize users usage, and also charts.

Telsoft Limited has forged a relationship with MikroTik, to supply their Internet Gateway devices to provide a Total Internet Access Solution. Telsoft Limited recommends MikroTik as its preferred internet gateway solution.

REQUIREMENTS

Windows 98, ME, 2000, XP or 2003
Pentium II 400, 128MB RAM, 10MB Disk Space

RECOMENDED

Windows 2000 or greater
Pentium III 1.5GHz, 256 MB RAM, 10 MB Disk Space

TECHNICAL SPECIFICATION

TrafficTracker requires an Internet Gateway that supports the Radius Protocol for authorization and traffic statistics.
